- Naslov promijenjeno iz java/scala play framework u java/scala play framework, pinky

pinky

Pinky is a Scala REST/MVC glue web framework built on top of Guice and Guice Servlet 2.0.

Features

- No custom template language
- (almost) No XML configuration
- URL/template mapping is convention based but can be easily overwritten
- Form generator/validator
- Jdbc helper
- Out of the box support for the following representations:
 - XML (via xstream or scala)
 - JSON (via xstream or json lib)
 - RSS 2.0
 - FreeMarker
 - Velocity
- akka integration
- scheduler for akka jobs
- comet integration (based on jetty7 continuation , note it does not require a jetty container though)
 - Controllers are plain old servlets
- Form validator and generator
- Named regex group capturing in url mappings
- Filters are implemented as plain old filters
- Filters/Servlet creation and mapping are managed by Guice
- Out of the box support for REST via managed servlets
- AOP support for servlet/filters and for regular components (via Guice)
- No learning curve (we are dealing with plain old servlets/filters after all)
- Dependency injection (powered by Guice)
- Scoped components ie Request, Session, custom scopes (powered by Guice)

- Ease access to other Guice modules like warp-persist for db persistence
- Easy access to Request/Response objects
- Easy to integrate with existing projects (thanks to servlets)
- Easy to extend
- new API to deal with jdbc
- support for form generation and validation

<http://cuisine.reelance.com/>

Welcome to Cuisine. This is a user-generated wiki (though still edited), which yields a lot of examples in order to extend the already excellent documentation on the main page.

Feel free to add an own recipe. However the recipes are moderated in order to occur on the frontpage.
