ldutils

A package of language independent tools that indexes program identifiers, literal numbers, or words of human-readable text. Through an "ID database," a binary file containing a list of filenames, a list of tokens, and a simple matrix indicating which tokens appear in which files, text-searching tasks become simpler and faster.

The ID utilities handle more than just identifiers; they also treat other kinds of tokens, including numeric constants, and the contents of certain character strings. Database queries can be issued from the command-line, or from within emacs, serving as an augmented tags facility.

Programs included are:

mkid: (id-utils)mkid invocation. Creating an ID database.

- lid: (id-utils)lid invocation. Matching words and patterns.
- fid: (id-utils)fid invocation. Listing a file's tokens.
- fnid: (id-utils)fnid invocation. Looking up file names.
- xtokid: (id-utils)xtokid invocation. Testing mkid scanners.
